

Speed by Black Homo Sapiens on The Isles

(Graph to be inserted)

We are all animals of the Earth and we co-exist in our own ways .Primitive man when hunting knew how 'to listen', to feed the tribe, and their silent body language played the strategy to capture their prey. It is interesting that both the words 'silent' and 'listen' contain the same letters. Animal sounds gave coded messages to each another and the hunter honed their skill mastering their primal intentions so they could prey on them for a home cooked tasty meal or be eaten raw .The instinct of the hunter man was so strong because they had to learn to survive to exist even in a bloodied way because that is what animals do too .Everyone is competing to survive.

It is necessary to insist to conclude in this chapter because in the face of adversity tears away from us all but the things that cannot be torn, so that afterwards we can see ourselves as we really are and not merely as we might like to be . It is like knowing how much we are worth by finding what we are wearing, if any, when the tide goes out. Understood as 'culturally bankrupt'. Strangely primal hunter never wore clothes and were seen as they were and did not show value.

Before continuing, let's not conclude that the word 'hooker' means, a prostitute.

The lore about "fighting Capt. John Hooker" in the American Civil War is partially true when he allowed his men to loosen their morals with strange women .He might not be the progenitor of the term 'hooker' , but certainly helped it become more widely known.

This conclusion is more serious and for a different reason. The monkey is the progenitor of the first word 'hooker' and as in 'hooker boat' found off the west coast of Ireland .This ancient boat has sails .This chapter may be the only explanation ever given to date how man learned his words from a monkey and then applied them.

Science has proven that Monkeys on the west coast of Africa give out a sound that resonates with 'hooker' and can be spelt in various ways and all sounding similar depending on dialects. This unique sound captured on recording is heard when a crown eagle in flight is seen and is used to indicate speed 'to escape' and 'pending sudden arrival' of this bird of prey to attack usually a troop of monkeys. It denotes 'speed'. Eagles identify thermal columns rising from the ground, spread their giant wings and allow the hot air to lift themselves upwards.

The graph attempts to demonstrate the initial perception of the monkey when making sight of this bird to its 'wing span' and how this same idea is also used by man when he made the boat sails of the hooker boat .Man is seen beside the monkey listening and silent .The hooker boat is a modification of the Gaal boat, a word, that also is from Africa as per the earlier compendium. Mechanical designers have continued to use the wingspan of an eagle when designing modern jet fighters .Someday a new modern jet fighter plane will share this appellation...hooker.

From the middle of the Jungle in Africa to the west coast of Ireland this word has travelled by man via monkey from an ancient time and is still relevant today. So has its idea traversed the Atlantic showing the influence this inception has done to contribute to man's quest to create more speed in flight even to another world on a different planet!

It is interesting to note that primitive man on the islands of Britain and Ireland had various words (see compendium) for different designations of territorial boundaries that survive in 'Old Irish Gaelic' only, having been lost to the famine period since and deleted in present Irish/ Gaelic. Animals too use sounds to share important information about various boundaries and primitive man followed their practice into spoken language. This original bench mark indicates how in present day Irish/Gaelic language the rule of business law has subsumed below the standard code of the level of monkey language standard and the Irish banking crisis bears this out .The States' policy to allow the departure of Gaelic from its primal natural root source from Africa will allow happen a demise of the true language structure it originally was and subscribe to its extermination in due course.

Finally, human song was the precursor to spoken language and monkey sounds were the precursor to human song .The traditional Irish singing sean-nos, sang without music should now appeal to more than a discerning few.

Research in science demonstrates how successful information is gathered to decipher about monkey language spoken between themselves but has failed to initiate how man in an older time was able to use what they had learned from monkey sounds and being able to apply it in any human language .Ancient Gaelic is fortunate and holds the code to exploring more and in good time its importance will finally be recognized. This substantiates the claim to conclude in this presentation. Comparing the words in this compendium with other European languages as demanded by pure linguists would best be served with the monkeys who will show you how to speak proper original primal Gaelic.

Perhaps the Monkey Song resonate everything 'Oo oo oo I Want to be like you oo oo '; sounds better.
